

Make Private Business as an Infrastructure.

We convince that this idea raises the happiness of consumers and enriches human imagination. Generally speaking, it may be very difficult for the private sector to provide infrastructure that will serve as the social, living, and economic infrastructure of the people. Currently, the maintenance and development are carried out by the central government and local governments that have absolute trust. However, with this centralized social composition and current financial resources (national tax revenue), it is difficult to bring about speedy social change, and we believe that the government will eventually reach its limits.

We, BRIDGE's main businesses, Decentralized Identity (DID) and Decentralized Data Bank, uses blockchain technology to securely manage personal information and turn it into rewards for individuals. We are confident that the basic income system can be easily realized. The spread of DID and DataBank will bring about social change, solve social issues, and realize a society where each and every consumer can live happily.
